Cariostatic

Dental Caries Inhibiting Agent

Cariostatic AF do BRASIL is a 12% or 30% solution of silver diamine fluoride, widely used in dentistry as an inhibitor of dental caries. This preventive protection is due to the presence of silver, also having a preventive remineralization action, as a curative action, in the case of paralysis of carious lesions and anti-microbial action.

Silver diamine fluoride forms with the tooth surface stable compounds of calcium fluoride, silver phosphate and silver proteinate, which provide greater strength to the tooth structure.

INDICATION

Indicated as an inhibitor of dental caries, preventing the formation of bacterial plaque and demineralization of the enamel surface. Prevents the progression of already installed caries. Used especially for caries in children and night-time bottle feeding. It works on both enamel and dentin.

PRESENTATION

Box with 1 (one) bottle containing 5ml of Cariostatic 30% AF do BRASIL or Box with 1 (one) bottle containing 10ml of Cariostatic 12% AF do BRASIL.
