2% Dental Desensitizer

Dental Desensitizer 2% is a low viscosity gel based on potassium nitrate with neural desensitizing action. Potassium nitrate has been considered a very effective agent in the treatment of hyperesthetic dentin. Its action occurs with an increase in the concentration of extracellular potassium, which depolarizes the nerve fiber membranes, blocking the passage of the stimulus, reducing hypersensitivity. It should only be used for professional use.

INDICATION

Indicated in dental treatment to relieve sensitivity triggered by thermal and chemical agents. It is also indicated in the treatment of sensitivity caused by tooth whitening.

PRESENTATION

Box with 1 (one) 3g syringe of 2% Dental Desensitizer AF do BRASIL + 1 (one) applicator tip.
