Liquid Trisodium EDTA

Chelating Agent

Liquid Trisodium EDTA AF do BRASIL is a chelating agent that acts by demineralizing dentin particles by chelation of calcium and magnesium ions, facilitating their dissolution and absorption. It is more biocompatible than other acids because it is organic and is capable of cleaning the dentinal tubules. It is a substance frequently used in dental practice (endodontics), proving to be an effective chelating and lubricating agent.

INDICATION

Indicated to facilitate the endodontic instrumentation, in the chemical treatment of the root in periodontal surgery, as an adjunct in the scaling of the root surface and in the removal of dentinal remains from the root canal to improve the cementation of cores.

PRESENTATION

Box with 1 (one) bottle containing 20ml of Liquid Trisodium EDTA AF do BRASIL.

n° 80432410030
